

a transmissive region of the display for displaying image data in a transmission mode using light entering through the first substrate, wherein the reflective region includes at least one transparent pixel electrode supported by the first substrate;

a reflective region of the display for displaying image data in a reflective mode using light entering through the second substrate, wherein the reflective region includes at least one reflective pixel electrode supported by the first substrate; and

wherein the second substrate further supports at least one light diffusion layer, the light diffusion layer being located between at least the second substrate and the liquid crystal layer.

16. (New) The display of claim 15, wherein the light diffusion layer supported by the second substrate is located between said color filter layer and said liquid crystal layer.

17. (New) The display of claim 15, wherein the light diffusion layer is located between a driving transparent electrode supported by the second substrate and an alignment layer supported by the second substrate.

18. (New) The display of claim 15, wherein the light diffusion layer supported by the second substrate is located at least partially between said second substrate and a transparent driving electrode supported by the second substrate.

19. (New) A transreflective liquid crystal display comprising:
